

Day 1 Assignment(Gen AI Python)

The screenshot shows a Jupyter Notebook titled "GenAiPython.ipynb". The code in the first cell is a Python program that takes an attendance value as input and prints the corresponding marks based on a set of conditions. The conditions are: if attendance is 100, 5 marks; if attendance is 95 or greater, 4 marks; if attendance is 90 or greater, 3 marks; if attendance is 85 or greater, 2 marks; if attendance is 80 or greater, 1 mark; otherwise, 0 marks. The output of the program is shown in the second cell, where the input is 55 and the output is 0 marks.

```
[ ] attend = int(input("enter your attendance present:"))

if (attend == 100):
    print("you got 5 marks")
elif(attend >=95):
    print("you got 4 marks")
elif(attend >=90):
    print("you got 3 marks")
elif(attend >=85):
    print("you got 2 marks")
elif(attend >=80):
    print("you got 1 marks")
else:
    print("you got 0 marks")

... enter your attendance present:55
you got 0 marks
```

The screenshot shows a Jupyter Notebook titled "GenAiPython.ipynb" with three code cells. The first cell contains a Python program that takes two integers, k and n, as input and prints which one is greater along with the difference. The second cell shows the output of the first program for k=6 and n=7. The third cell contains a Python program that takes a list 'a' and prints the list with every second element, the list with every second element starting from index 1, and the reversed list.

```
[ ] k = int(input())
n = int(input())
if(k>n):
    print(k,"is greater and the difference is",k-n)
else:
    print(n,"is greater and the difference is",n-k)

6
7
7 is greater and the difference is 1

[ ] a=[1,2,3,4,5,6,7,8,9,10]
a[::2]

[1, 3, 5, 7, 9]

[ ] a=[1,2,3,4,5,6,7,8,9,10]
a[::-1]

[10, 9, 8, 7, 6, 5, 4, 3, 2, 1]
```
