Advanced pandas Series and DataFrame

apply()

is used to apply a function to every value in a Series or along rows and columns of a DataFrame

import pandas as pd

```
df = pd.DataFrame({"marks": [20, 30, 40, 50]})
```

```
df["marks"] = df["marks"].apply  
(lambda x: x+5)
```

Print (df)

lambda function

it's a small one line function without a function name

Mo Tu We Th Fr Sa Su

Date / /

Syntax:

lambda arguments : expression

arguments - input value

expression - Calculations performed and returned the expression automatically

```
Sqr = lambda (x): x * x
```

```
Print (Square(5))
```

25

map() Series

```
df["gender"] = df["gender"].  
map({"m": "male",  
     "f": "female"})
```

End to End
