

Pandas KeyWords

Name	Keyword / Syntax	Description
Import Pandas	<code>import pandas as pd</code>	Imports the Pandas library with the alias pd.
Series	<code>pd.Series()</code>	Creates a one-dimensional labeled array.
DataFrame	<code>pd.DataFrame()</code>	Creates a two-dimensional table of rows and columns.
Read CSV	<code>pd.read_csv()</code>	Reads data from a CSV file.
Read Excel	<code>pd.read_excel()</code>	Reads data from an Excel file.
Write CSV	<code>df.to_csv()</code>	Saves a DataFrame to a CSV file.
Write Excel	<code>df.to_excel()</code>	Saves a DataFrame to an Excel file.
Head	<code>df.head()</code>	Displays the first 5 rows of the DataFrame.
Tail	<code>df.tail()</code>	Displays the last 5 rows of the DataFrame.
Shape	<code>df.shape</code>	Returns the number of rows and columns.
Size	<code>df.size</code>	Returns the total number of elements.
Dimensions	<code>df.ndim</code>	Returns the number of dimensions.
Columns	<code>df.columns</code>	Returns the column names.
Index	<code>df.index</code>	Returns the row labels (index).
Data Types	<code>df.dtypes</code>	Displays the data type of each column.
Information	<code>df.info()</code>	Displays a summary of the DataFrame.
Description	<code>df.describe()</code>	Displays statistical summary of numerical columns.

Name	Keyword / Syntax	Description
Select Column	<code>df["Column"]</code>	Selects a single column.
Select Multiple Columns	<code>df[["A","B"]]</code>	Selects multiple columns.
Select Rows	<code>df.loc[]</code>	Selects rows and columns by labels.
Select by Position	<code>df.iloc[]</code>	Selects rows and columns by index positions.
Add Column	<code>df["New"] = value</code>	Adds a new column to the DataFrame.
Drop Column	<code>df.drop(columns=[])</code>	Removes one or more columns.
Drop Row	<code>df.drop(index=[])</code>	Removes one or more rows.
Rename Columns	<code>df.rename()</code>	Renames column names.
Sort Values	<code>df.sort_values()</code>	Sorts the DataFrame by column values.
Sort Index	<code>df.sort_index()</code>	Sorts the DataFrame by index.
Filter Rows	<code>df[df["Age"] > 20]</code>	Returns rows that satisfy a condition.
Missing Values	<code>df.isnull()</code>	Checks for missing (null) values.
Count Missing Values	<code>df.isnull().sum()</code>	Counts missing values in each column.
Remove Missing Values	<code>df.dropna()</code>	Removes rows containing missing values.
Fill Missing Values	<code>df.fillna()</code>	Replaces missing values with specified values.
Remove Duplicates	<code>df.drop_duplicates()</code>	Removes duplicate rows.
Count Values	<code>df["Col"].value_counts()</code>	Counts unique values in a column.
Unique Values	<code>df["Col"].unique()</code>	Returns unique values from a column.
Number of Unique Values	<code>df["Col"].nunique()</code>	Returns the number of unique values.

Name	Keyword / Syntax	Description
Group By	<code>df.groupby()</code>	Groups data based on one or more columns.
Merge DataFrames	<code>pd.merge()</code>	Combines two DataFrames using common columns.
Concatenate	<code>pd.concat()</code>	Combines multiple DataFrames vertically or horizontally.
Mean	<code>df.mean()</code>	Returns the average of numerical columns.
Sum	<code>df.sum()</code>	Returns the sum of numerical columns.
Maximum	<code>df.max()</code>	Returns the maximum value in each column.
Minimum	<code>df.min()</code>	Returns the minimum value in each column.
Count	<code>df.count()</code>	Counts non-null values in each column.
Apply Function	<code>df.apply()</code>	Applies a function to rows or columns.
Replace Values	<code>df.replace()</code>	Replaces specified values with new values.
Data Type Conversion	<code>df.astype()</code>	Converts columns to another data type.
Sample Rows	<code>df.sample()</code>	Returns random rows from the DataFrame.
Copy DataFrame	<code>df.copy()</code>	Creates a copy of the DataFrame.
Install Pandas	<code>pip install pandas</code>	Installs the Pandas library.
